## SPECIFICATION FOR

**BONDING AGENT  
FOR CONCRETE, RENDERS  
& PLASTERING**

# CALBOND\*

### REQUIREMENT:

Bonding to brick, concrete or masonry, without roughening or hacking. Bonding agent for interior renders and toppings, as well as for bonding concrete at concrete construction joints, etc.

### PRODUCT TO USE:

## CALBOND

### HOW TO SPECIFY:

All surfaces (state areas) shall be prepared for plastering/rendering by application of a liberal coat of **CALBOND** which shall be allowed to dry to a "tacky" condition (10 – 20 minutes) before applying render or plaster. Consult manufacturer for details of surface cleaning, etc.

### EFFECTS:

**CALBOND** forms a plastic "key" into the surface pores of the base masonry, which when not fully dry will partially re-dissolve in the damp render or plaster. When set and dried, the whole sets into a hard, tough unit strongly assisting firm adhesion of the surface render. Fully compatible with all CEMENTAID products.

### WHERE RECOMMENDED:

All rendering onto non-roughened surfaces, including integrally waterproofed concrete.

Repair of cracks and faults in masonry.

As admixture in mortar or concrete mix, where elasticity and toughness are required

NOTE: For service under wet areas or wetting drying conditions, Cementaid WELDCRETE is recommended to be used instead.

### FOR NEW FLOOR TOPPINGS

A slurry of **CALBOND** and cement mixed in the proportions of 2 parts **CALBOND**, 2 parts cement and 1 part water, when applied liberally on a clean surface will assist adhesion of applied toppings.

All toppings must be well cured.
